Background

ComicCraft combines story generation, illustration generation, web presentation, and PDF export into one application. The supplied documentation describes the project as an AI comic story creator with a five-panel workflow.

Problem Statement

Creating a comic manually requires story planning, panel scripting, illustration, layout, and document preparation. ComicCraft automates these stages from a structured user prompt.

Objectives

- Provide a browser-based interface for creating a comic.
- Generate exactly five connected story panels.
- Maintain the same protagonist and visual identity throughout the outline.
- Generate captions and narration/dialogue for every panel.
- Generate panel illustrations using configurable image backends.
- Provide a downloadable PDF version of the comic.

Scope

The supplied implementation covers the FastAPI web application, Gemini-based outline and story generation, image generation, comic layout construction, PDF export, demo mode, and automated tests.
